B-ALL Monitoring, MRD Detection, V

Final Diagnosis

MCR

Peripheral blood, flow cytometric immunophenotyping:

No abnormal immature B-cell population is detected (MRD-negative).

Comment: Minimal residual disease (MRD) is intended to detect small residual populations of B-lymphoblastic leukemia/lymphoma (B-ALL) cells following chemo/immunotherapy or bone marrow transplantation. The sensitivity of this MRD test is 0.002%. Previous therapy targeting cell surface antigen(s) can interfere with this assay's performance. Correlation with clinical features and other laboratory findings is necessary. Contact the signing pathologist at 1-800-533-1710 if there are questions about this analysis.

Special Studies

MCR

Results:

Blasts: Not increased, ALL MRD negative by CD10, CD19, CD20, CD22, CD24, CD34, CD38, CD45, CD58, and CD66c expression.

Quality assessment: Specimen received within validated guidelines.

Microscopic Description

1 MCR

A submitted Wright-Giemsa slide and a Wright-Giemsa-stained slide prepared from the flow cytometry specimen are examined.
