Overview

Useful For
Measuring IgG anti-*Saccharomyces cerevisiae* antibodies as a part of a profile to aid in distinguishing between ulcerative colitis and Crohn disease in patients for whom the specific diagnosis is unclear based on endoscopic, pathologic, and imaging evaluations.

This test is not useful for determining the extent of disease in patients with inflammatory bowel disease or determining the response to disease-specific therapy including surgical resection of diseased intestine.

Method Name
Enzyme-Linked Immunosorbent Assay (ELISA)

NY State Available
Yes

Specimen

Specimen Type
Serum

Specimen Required
Collection Container/Tube:
Preferred: Serum gel
Acceptable: Red top

Submission Container/Tube: Plastic vial
Specimen Volume: 0.5 mL
Collection Instructions: Centrifuge and aliquot serum into a plastic vial.

Specimen Minimum Volume
0.4 mL

Reject Due To

Clinical & Interpretable

Clinical Information

Inflammatory bowel disease (IBD) refers to 2 diseases, ulcerative colitis (UC) and Crohn disease (CD, regional enteritis), both of which result from chronic inflammation in the gastrointestinal (GI) tract.(1) CD is characterized by chronic diarrhea, abdominal pain, and fatigue.(2) In comparison, UC frequently presents with bloody diarrhea that is of an urgent nature.(3) Inflammation in UC most frequently affects the rectum and proximal colon, and presents with continue mucosal involvement. In CD, inflammation can affect almost any area of the GI tract, and is usually evidenced as patchy, transmural lesions.

Diagnosis of IBD is primarily based on clinical evaluation, endoscopy with biopsy, and imaging studies.(4) Because CD and UC are characterized by GI inflammation, fecal calprotectin can be used to differentiate IBD from non-inflammatory conditions such as irritable bowel syndrome (IBS). Fecal calprotectin is useful in excluding IBD as a diagnosis and avoiding unnecessary endoscopic or imaging procedures.

CD and UC are associated with the presence of various anti-microbial and autoantibodies.(5) Patients with UC often have measurable antineutrophil cytoplasmic antibodies (ANCA), which react with as yet uncharacterized target antigens in human neutrophils; in contrast, patients with CD often have measurable IgA and/or IgG antibodies which react with cell wall mannan of Saccharomyces cerevisiae. Despite these associations, current guidelines indicate that testing for these antibodies is not sufficiently sensitive for use in the diagnosis of IBD.(2,3) Rather, these antibodies should be limited to distinguishing between CD and UC in cases where the specific diagnosis is unclear based on pathologic and imaging studies.

Reference Values

Negative: <20.0 RU/mL
Positive: ≥20.0 RU/mL
Reference values apply to all ages.

Interpretation

The presence of antineutrophil cytoplasmic antibodies (ANCA) in the absence of IgA and IgG anti-Saccharomyces cerevisiae antibodies (ASCA) is consistent with the diagnosis of ulcerative colitis; the presence of IgA and IgG ASCA in the absence of ANCA is consistent with Crohn disease.

Cautions

Results from this test should not be exclusively relied upon to establish the diagnosis of ulcerative colitis (UC) or Crohn disease (CD) or to distinguish between these 2 diseases. Saccharomyces cerevisiae IgA and IgG antibodies (ASCA) are
most useful for distinguishing between UC and CD when assessed in conjunction with antineutrophil cytoplasmic antibodies (ANCA).

Some patients with CD have detectable ANCA, and some patients with UC have detectable IgA and/or IgG ASCA. Some patients with UC or CD do not have detectable ANCA, IgA ASCA, or IgG ASCA.

**Clinical Reference**

**Performance**

**Method Description**
Immunoglobulin G (IgG) anti-*Saccharomyces cerevisiae* antibodies (ASCA) are measured by commercial, microtiter enzyme immunoassay. This assay uses polystyrene microtiter plates coated with purified mannan from the cell wall of *S cerevisiae* to capture antibodies from patient sera and horseradish peroxidase-conjugated anti-IgG antibodies to detect IgG ASCA. Results of the test for IgG ASCA are reported in relative units per milliliter (RU/mL). (Package insert: Anti-Saccharomyces cerevisiae ELISA (IgG). EUROIMMUN Medizinische Labordiagnostika AG; 5/2011)

**PDF Report**
No

**Day(s) Performed**
Tuesday, Thursday

**Report Available**
2 to 4 days

**Specimen Retention Time**
14 days

**Performing Laboratory Location**
Rochester
Fees & Codes

**Fees**
- Authorized users can sign in to [Test Prices](#) for detailed fee information.
- Clients without access to Test Prices can contact [Customer Service](#) 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact [Customer Service](#).

**Test Classification**
This test was developed, and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. This test has not been cleared or approved by the US Food and Drug Administration.
