Lupus Anticoagulant Profile Testing Algorithm

ALUPP / Lupus Anticoagulant Profile, Plasma
Testing begins with:
- Prothrombin time (PT)
- Activated partial thromboplastin time (APTT)
- Dilute Russell viper venom time (DRVVT)

**Weak lupus anticoagulant may not inhibit DRVVT Mix**

Additional assays may be performed if further clarification or confirmation is necessary based on preliminary review. These may include:
- Coagulation Factor Assays
- Bethesda Units
- Fibrinogen
- Soluble Fibrin Monomer
- Staclot Lupus Anticoagulant
- D-Dimer
- von Willebrand Factor Assays

Unfractionated/low-molecular weight heparin or direct thrombin inhibitor (eg, dabigatran, argatroban) warfarin or low concentration of direct anti-Xa inhibitor (eg, rivaroxaban, apixaban, or edoxaban)

An interpretive report is included with this profile. If any tests are abnormal, all results will be reviewed by a coagulation consultant.
