Overview

Useful For
Detecting a neoplastic clone associated with the common chromosome abnormalities seen in patients with various T-cell lymphomas

Tracking known chromosome abnormalities and response to therapy in patients with T-cell lymphoma

Reflex Tests

Testing Algorithm
This test includes a charge for application of the first probe set (2 FISH probes) and professional interpretation of results. Additional charges will be incurred for all reflex probes performed. Analysis charges will be incurred based on the number of cells analyzed per probe set. If no cells are available for analysis, no analysis charges will be incurred.

When this test and flow cytometry testing for leukemia/lymphoma are ordered concurrently, the flow cytometry result will be utilized to determine if sufficient clonal T-cells are available for FISH testing. If the result does not identify a sufficient clonal T-cell population, this FISH test order will be canceled and no charges will be incurred.

If FISH testing proceeds, probes will be performed based on the lymphoma subtype suspected/identified utilizing the table located in Clinical Information.

If the patient is being tracked for known abnormalities, indicate which probes should be used.

The following probe sets are available within the T-cell lymphoma FISH profile:

14q32.1 rearrangement, TCL1A

/i(7q)/ -7/7q-, D7S486/D7Z1

+8, D8Z2/MYC

If T-cell prolymphocytic leukemia/lymphoma (T-PLL) is indicated, TCL1A rearrangement is performed, with reflex to the TRAD FISH probe if TCL1A is negative.

See Bone Marrow Staging for Known or Suspected Malignant Lymphoma Algorithm in Special Instructions.
Test Definition: TLPF
T-cell Lymphoma, FISH, B/BM

Special Instructions
- Bone Marrow Staging for Known or Suspected Malignant Lymphoma Algorithm

Method Name
Fluorescence In Situ Hybridization (FISH)

NY State Available
Yes

Specimen

Specimen Type
Varies

Advisory Information
This assay detects chromosome abnormalities observed in the blood or bone marrow of patients with T-cell lymphoma.

- For testing paraffin-embedded tissue samples from patients with T-cell lymphoma, see TLYM / T-Cell Lymphoma, FISH, Tissue.

- For patients with T-cell acute lymphoblastic leukemia/lymphoma, order TALLF / T-Cell Acute Lymphoblastic Leukemia [T-ALL], FISH, Varies.

Shipping Instructions
Advise Express Mail or equivalent if not on courier service.

Necessary Information
1. Provide a reason for referral with each specimen. The laboratory will not reject testing if this information is not provided, but appropriate testing and interpretation may be compromised or delayed.

2. A pathology or flow cytometry report may be requested by the Genomics Laboratory to optimize testing and aid in interpretation of results.

Specimen Required
Submit only 1 of the following specimens:

Preferred:

Specimen Type: Bone marrow

Container/Tube: Green top (sodium heparin)

Specimen Volume: 1-2 mL

Collection Instructions: Invert several times to mix bone marrow.

Acceptable:
**Specimen Type:** Blood

**Container/Tube:** Green top (sodium heparin)

**Specimen Volume:** 7-10 mL

**Collection Instructions:** Invert several times to mix blood.

**Forms**
If not ordering electronically, complete, print, and send a [Hematopathology/Cytogenetics Test Request](#) (T726) with the specimen.

**Specimen Minimum Volume**
- Blood: 2 mL
- Bone Marrow: 1 mL

**Reject Due To**
No specimen should be rejected.

**Specimen Stability Information**

**Clinical and Interpretive**

**Clinical Information**

T-cell neoplasms are relatively uncommon, accounting for approximately 12% of all non-Hodgkin lymphomas. There are several subtypes of T-cell neoplasms: T-cell acute lymphoblastic leukemia (T-ALL), T-cell prolymphocytic leukemia (T-PLL), T-cell large granular lymphocytic leukemia (T-LGL), anaplastic large cell lymphoma (ALCL), peripheral T-cell lymphoma, and various other cutaneous, nodal, and extranodal lymphoma subtypes.

There are a few common chromosome abnormalities associated with specific T-cell lymphoma subtypes evaluated by this FISH test, as follows:

Document generated June 24, 2020 at 9:08am CDT
These probes have diagnostic relevance and can also be used to track response to therapy.

**Reference Values**
An interpretive report will be provided.

**Interpretation**
*A neoplastic clone is detected when the percent of cells with an abnormality exceeds the normal reference range for any given probe.*

Detection of an abnormal clone supports a diagnosis of a T-cell lymphoma. The specific abnormality detected may help subtype the neoplasm.

The absence of an abnormal clone does not rule out the presence of neoplastic disorder.

**Cautions**
This test is not approved by the U.S. Food and Drug Administration and it is best used as an adjunct to existing clinical and pathologic information.

Bone marrow is the preferred sample type for this FISH test. If bone marrow is not available, a blood specimen may be used if there are malignant cells in the blood specimen (as verified by hematopathology).

**Supportive Data**
Each probe was independently tested on a set of normal bone marrow control samples, and when available bone marrow samples from patients diagnosed with a T-cell lymphoma. Normal cutoffs were calculated based on the results from 25 normal specimens. Each probe set was evaluated to confirm the probe set detected the abnormality it was designed to detect.

**Clinical Reference**
1. WHO Classification of Tumours of Haematopoietic and Lymphoid Tissues. Edited by SH Swerdlow, et al. IARC, Lyon 2017

**Performance**

**Method Description**
This test is performed using commercially available and laboratory-developed probes. Rearrangements involving *TCL1* and *TRAD* are detected using a dual-color break-apart (BAP) strategy probe. Trisomy of chromosome 8 and isochromosome 7q are detected using enumeration strategy probes. For each probe set, 200 interphase nuclei are scored and results are expressed as the percent abnormal nuclei.(Unpublished Mayo method)

**PDF Report**
No

**Day(s) and Time(s) Test Performed**
Specimens processed Monday through Sunday.

Results reported Monday through Friday, 8 a.m.-5 p.m.

**Analytic Time**
7 days

**Maximum Laboratory Time**
10 days

**Specimen Retention Time**
4 weeks

**Performing Laboratory Location**
Rochester

**Fees and Codes**

**Fees**
- Authorized users can sign in to [Test Prices](#) for detailed fee information.
- Clients without access to Test Prices can contact [Customer Service](#) 24 hours a day, seven days a week.
- Prospective clients should contact their Regional Manager. For assistance, contact [Customer Service](#).

**Test Classification**
This test was developed using an analyte specific reagent. Its performance characteristics were determined by Mayo Clinic in a manner consistent with CLIA requirements. This test has not been cleared or approved by the U.S. Food and Drug Administration.

**CPT Code Information**
- 88271x2, 88291-DNA probe, each (first probe set), Interpretation and report
- 88271x2-DNA probe, each; each additional probe set (if appropriate)
- 88271x1-DNA probe, each; coverage for sets containing 3 probes (if appropriate)
- 88271x2-DNA probe, each; coverage for sets containing 4 probes (if appropriate)
- 88271x3-DNA probe, each; coverage for sets containing 5 probes (if appropriate)
- 88274 w/modifier 52-Interphase in situ hybridization, <25 cells, each probe set (if appropriate)
- 88274-Interphase in situ hybridization, 25 to 99 cells, each probe set (if appropriate)
- 88275-Interphase in situ hybridization, 100 to 300 cells, each probe set (if appropriate)
