Overview

Useful For
Diagnosis of coronavirus disease 2019 (COVID-19) illness due to severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2)

Recommended only for patients who meet current clinical and/or epidemiologic criteria defined by federal, state, or local public health directives: www.cdc.gov/coronavirus/2019-nCoV/hcp/clinical-criteria.html

Highlights
Provides qualitative detection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) RNA from select upper and lower respiratory tract specimens from symptomatic patients under investigation (PUI) for coronavirus disease 2019 (COVID-19).

Fact sheets for this emergency use authorization (EUA) assay can be found at the following links:

For patients: https://www.fda.gov/media/136257/download

Special Instructions

COVID-19 Oropharyngeal Collection Instructions

Method Name
Real-Time Polymerase Chain Reaction (RT-PCR)

NY State Available
Yes

Specimen

Specimen Type
Varies

Advisory Information
This test should be used for symptomatic patients under investigation for coronavirus disease 2019 (COVID-19). It is not to be used for screening asymptomatic patients.

Shipping Instructions
Ship specimens refrigerated (if less than 72 hours from collection to arrive at MCL) or frozen (if greater or equal to 72 hours from collection to arrive at MCL).

Necessary Information
1. Patient’s race and ethnicity, as well as specimen source, are required.

2. If ordering electronically, answers must be provided for the order entry questions.

3. If not ordering electronically, patient race and ethnicity must be provided on the request form.
Specimen Required

Specimen Type: Nasopharyngeal (NP), oropharyngeal (OP; ie, throat), nares/nasal, or nasal mid-turbinate swab

Supplies: Swab, Sterile Polyester (T507)

Container/Tube: Universal transport media, viral transport media, or equivalent (eg, Copan UTM-RT, BD VTM, MicroTest M4, M4-RT, M5). Media should not contain guanidine thiocyanate (GTC).

For more information on alternative transport media, see www.fda.gov/medical-devices/emergency-situations-medical-devices/faqs-diagnostic-testing-sars-cov-2

Specimen Volume: Entire collection with a minimum of 2.2 mL (maximum 3 mL) of transport medium

Collection Instructions:

1. Collect specimen by swabbing back and forth over nasal or pharyngeal mucosa surface to maximize recovery of cells. For more information on OP swab specimen collection, see COVID-19 Oropharyngeal Collection Instructions in Special Instructions.

2. NP and OP swab specimens may be combined at collection into a single vial of transport media but only one swab is required for analysis.

3. Swab must be placed into transport medium. Swab shaft should be broken or cut so that there is no obstruction to the sample or pressure on the media container cap.

4. Do not send in glass tubes, vacutainer tubes, or tubes with push caps.

5. Do not overfill with more than 3 mL total volume of media.

Specimen Type: Nasopharyngeal aspirate, nasal washing

Container/Tube: Sterile container

Specimen Volume: Minimum of 1.5 mL

Additional Information: Do not aliquot into viral transport media glass tubes, vacutainer tubes, or tubes with push caps.

Specimen Type: Lower respiratory tract

Sources: Bronchoalveolar lavage (BAL) fluid, bronchial washings, endotracheal aspirate, sputum

Container/Tube: Sterile container

Specimen Volume: Minimum of 2.2 mL

Additional Information: Do not aliquot into viral transport media glass tubes, vacutainer tubes, or tubes with push caps.

Forms
If not ordering electronically, complete, print, and send a General Request (T239) with the specimen.

**Clinical and Interpretive**

**Clinical Information**

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) virus is a positive-sense, single-stranded RNA virus that causes coronavirus disease 2019 (COVID-19). Like other coronaviruses that infect humans, SARS-CoV-2 can cause both upper and lower respiratory tract illness. Symptoms can range from mild (ie, the common cold) to severe (ie, pneumonia) in both healthy and immunocompromised patients. SARS-CoV-2 transmission occurs primarily via respiratory droplets. During the early stages of COVID-19 disease, the symptoms maybe nonspecific and resemble other common respiratory infections, such as influenza. If testing for other respiratory infections is negative, specific testing for SARS-CoV-2 (COVID-19) may be warranted.

SARS-CoV-2 is likely to be at the highest concentrations in the nasopharynx during the first 3 to 5 days of symptomatic illness. As the disease progresses, the viral load tends to decrease in the upper respiratory tract, at which point lower respiratory tract specimens (eg, sputum, tracheal aspirate, bronchoalveolar fluid) would be more likely to have detectable SARS-CoV-2.

**Reference Values**

Undetected

**Interpretation**

A Detected result indicates that severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) RNA is present and suggests the diagnosis of coronavirus disease 2019 (COVID-19). Test result should always be considered in the context of patient's clinical history, physical examination, and epidemiologic exposures when making the final diagnosis.

An Undetected result indicates that SARS-CoV-2 is not present in the patient's specimen. However, this result may be influenced by the stage of the infection, quality and type of specimen collected for testing. Result should be correlated with patient's history and clinical presentation.
Test Definition: SARS2
SARS Coronavirus 2 RNA, V

An inconclusive result indicates that the presence or absence of SARS-CoV-2 RNA in the specimen could not be determined with certainty after repeat testing in the laboratory, possibly due to RT-PCR inhibition. Submission of a new specimen for testing is recommended.

Cautions
The FDA has provided emergency use authorization (EUA) of this test for testing human nasopharyngeal, oropharyngeal (throat), and nasal swab specimens. The assay is adapted to test lower respiratory tract specimens, such as bronchial washing, bronchoalveolar lavage (BAL) fluid.

The sensitivity of the assay is dependent on the timing of the specimen collection (in relation to symptom onset), quality and type of specimen submitted.

The test is specific for severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2); therefore, the results do not exclude the possibility of infection with other respiratory viruses.

Undetected (ie, negative) results do not rule out coronavirus disease 2019 (COVID-19) in patients and should not be used as the sole basis for treatment or other patient management decisions. Result should be correlated with patientâ€™s history and clinical presentation.

Clinical Reference

Performance

Method Description
The Abbott RealTime SARS-CoV-2 assay is performed using the FDA-approved, semi-automated Abbott m2000 system, which comprises the Abbott m2000sp sample preparation instrument and the Abbott m2000rt real-time PCR thermocycler. The AbbottmSample Preparation System kit is used on the Abbottm2000spinstrument, based on magnetic microparticle technology, to extract and purify viral RNA from clinical upper respiratory tract swab specimens and assay controls (negative and positive) placed in 96-well microtiter plate format. An internal control is also added to the extraction reagents and carried through the entire process in each specimen to ensure adequate extraction and subsequent target amplification have occurred free of inhibitory substances.

The PCR assay mastermix contains 3 sets of primers and TaqMan probes targeting sequences in the RdRp and N genomic regions of SARS-CoV-2 and the internal control armored RNA. Amplification and detection of target sequences are performed on the Abbottm2000rtthermocycler. Clinical samples containing SARS-CoV-2 would yield detectable signals for the RdRp and N sequences (FAM-labeled fluorescent probes) as well as the internal control gene sequence (VIC-labeled fluorescent probe) (Package insert: Abbott RealTime SARS-CoV-2. Fees and Codes

Fees
- Authorized users can sign in to Test Prices for detailed fee information.
- Clients without access to Test Prices can contact Customer Service 24 hours a day, seven days a week.
- Prospective clients should contact their Regional Manager. For assistance, contact Customer Service.

Test Classification
This test has received Emergency Use Authorization (EUA) by the U.S. Food and Drug Administration and is used per manufacturer’s instructions in testing upper respiratory tract specimens, but it is modified from the manufacturer’s instructions with a bridging study in testing lower respiratory tract specimens. Performance characteristics were verified by Mayo Clinic in a manner consistent with CLIA requirements.
