

# JAK2 Exon 12 and Other Non-V617F Mutation Detection, Bone Marrow

# Overview

### **Useful For**

Second-order testing to aid in the distinction between a reactive cytosis and a myeloproliferative neoplasm, particularly when a diagnosis of polycythemia is being entertained; for use with bone marrow specimens

### **Testing Algorithm**

This is a second-order test that should be used when the test for the JAK2M / JAK2 V617F Mutation Detection, Bone Marrow test is negative.

See <u>Myeloproliferative Neoplasm: A Diagnostic Approach to Bone Marrow Evaluation</u> in Special Instructions.

### **Special Instructions**

- Myeloproliferative Neoplasm: A Diagnostic Approach to Bone Marrow Evaluation
- Hematopathology Patient Information

#### Method Name

Mutation Detection in cDNA Using Sanger Sequencing

### NY State Available

Yes

# Specimen

# Specimen Type

Bone Marrow

# **Ordering Guidance**

In all cases being evaluated for *JAK2* mutation status, the initial test that should be ordered is JAK2M / *JAK2* V617F Mutation Detection, Bone Marrow, a sensitive assay for detection of the mutation. However, if no *JAK2* V617F mutation is found, further evaluation of *JAK2* may be clinically indicated.

This test is a second-order test that should be ordered when the test for the JAK2M / JAK2 V617F Mutation Detection, Bone Marrow test is negative.

#### **Shipping Instructions**

#### 1. Specimen must arrive within 5 days (120 hours) of collection.

2. Draw and package specimen as close to shipping time as possible.

#### **Necessary Information**

# JAK2 Exon 12 and Other Non-V617F Mutation Detection, Bone Marrow

Date of collection is required.

# Specimen Required

Container/Tube: Preferred: EDTA (lavender top) Acceptable: ACD (yellow top) Specimen Volume: 4 mL Collection Instructions: 1. Invert several times to mix bone marrow.

2. Send specimen in original tube.

# Forms

# 1. <u>Hematopathology Patient Information</u> (T676) in Special Instructions

2. If not ordering electronically, complete, print, and send a <u>Hematopathology/Cytogenetics Test Request</u> (T726) with the specimen.

# **Specimen Minimum Volume**

2 mL

# **Reject Due To**

| Gross     | Reject                         |
|-----------|--------------------------------|
| hemolysis |                                |
| Other     | Moderately to severely clotted |

# **Specimen Stability Information**

| Specimen Type | Temperature              | Time   | Special Container       |
|---------------|--------------------------|--------|-------------------------|
| Bone Marrow   | Refrigerated (preferred) | 5 days | PURPLE OR PINK TOP/EDTA |
|               | Ambient                  | 5 days | PURPLE OR PINK TOP/EDTA |

# **Clinical & Interpretive**

# **Clinical Information**

DNA sequence mutations in the Janus kinase 2 (*JAK2*) gene are found in the hematopoietic cells of several myeloproliferative neoplasms (MPN), most frequently polycythemia vera (close to 100%), essential thrombocythemia (approximately 50%), and primary myelofibrosis (approximately 50%). Mutations in *JAK2* have been reported at much lower frequency in other MPN, chronic myelomonocytic leukemia and mixed MPN/myelodysplastic syndromes, but essentially never in chronic myelogenous leukemia (CML), reactive cytoses, or normal patients. Mutations are believed to cause constitutive activation of the JAK2 protein, which is an intracellular tyrosine kinase important for signal transduction in many hematopoietic cells. Since it is often difficult to distinguish reactive conditions from the non-CML MPN, identification of a *JAK2* mutation has diagnostic value. Potential prognostic significance of *JAK2* mutation detection in chronic myeloid disorders has yet to be clearly established.

# JAK2 Exon 12 and Other Non-V617F Mutation Detection, Bone Marrow

The vast majority of *JAK2* mutations occur as base pair 1849 in the gene, resulting in a *JAK2* V617F protein change. In all cases being evaluated for *JAK2* mutation status, the initial test that should be ordered is JAK2M / *JAK2* V617F Mutation Detection, Bone Marrow, a sensitive assay for detection of the mutation. However, if no *JAK2* V617F mutation is found, further evaluation of *JAK2* may be clinically indicated. Over 50 different mutations have now been reported within exons 12 through 15 of *JAK2* and essentially all of the non-V617F mutations have been identified in polycythemia vera. These mutations include point mutations and small insertions or deletions. Several of the exon 12 mutations have been shown to have biologic effects similar to those caused by the V617F mutation such that it is currently assumed other nonpolymorphic mutations have similar clinical effects. However, research in this area is ongoing.

This assay for non-V617F/alternative *JAK2* mutations is designed to obtain the sequence for *JAK2* exons 12 through the first 90% of exon 15, which spans the region containing all mutations reported to date.

# **Reference Values**

An interpretive report will be provided.

# Interpretation

The results will be reported as 1 of 2 states:1. Negative for *JAK2* mutation2. Positive for *JAK2* mutation

If the result is positive, a description of the mutation at the nucleotide level and the altered protein sequence is reported.

Positive mutation status is highly suggestive of a myeloproliferative neoplasm, but must be correlated with clinical and other laboratory features for a definitive diagnosis. Negative mutation status does not exclude the presence of a myeloproliferative or other neoplasm.

# Cautions

A positive result is not specific for a particular diagnosis and clinico-pathologic correlation is necessary in all cases. A negative result does not exclude the presence of a myeloproliferative or other neoplasm.

If this test is ordered in the setting of erythrocytosis and suspicion of polycythemia vera, interpretation requires correlation with a concurrent or recent prior bone marrow evaluation.

# Supportive Data

Analytical sensitivity is approximately 20% meaning there must be about 20% of the mutated DNA in the sample for reliable detection.

# JAK2 Exon 12 and Other Non-V617F Mutation Detection, Bone Marrow

# Performance

# **Method Description**

Total RNA is extracted from bone marrow and cDNA synthesized from *JAK2* mRNA. A fragment spanning exons 12 through 15 is then amplified using standard PCR and the sequence is obtained using Sanger sequencing with analysis on an automated genetic analyzer.(Unpublished Mayo method)

PDF Report

No

Day(s) Performed Monday through Saturday

Report Available 5 to 8 days

Specimen Retention Time RNA 3 months

**Performing Laboratory Location** Mayo Clinic Laboratories - Rochester Main Campus

# Fees & Codes

#### Fees

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact Customer Service.

# **Test Classification**

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.

# **CPT Code Information**

0027U-JAK2 (Janus kinase 2) (eg, myeloproliferative disorder), exon 12 sequence and exon 13 sequence, if performed
