

Test Definition: APROL

Prolonged Clot Time Profile, Plasma

Overview

Useful For

Determining the cause of prolongation of prothrombin time or activated partial thromboplastin time

Screening for prolonged clotting times and determining the presence of factor deficiencies or inhibitor (eg, factor-specific, lupus-like, or the presence of heparin)

Profile Information

Test Id	Reporting Name	Available Separately	Always Performed
APRI	Prolonged Clot Time Prof Interp	No	Yes
PTSC	Prothrombin Time (PT), P	Yes, (order PTTP)	Yes
APTSC	Activated Partial Thrombopl Time, P	Yes, (order APTTP)	Yes
DRV1	Dilute Russells Viper Venom Time, P	Yes, (order DRV11)	Yes
TTSC	Thrombin Time (Bovine), P	Yes	Yes
CLFIB	Fibrinogen, Clauss, P	Yes, (order FIBTP)	Yes
DIMER	D-Dimer, P	Yes, (order DDITT)	Yes

Reflex Tests

Test Id	Reporting Name	Available Separately	Always Performed
GBETH	General Factor Bethesda Units, P	No	No
5BETH	FV Bethesda Units, P	No	No
8BETH	FVIII Bethesda Units, P	No	No
9BETH	FIX Bethesda Units, P	No	No
F8IS	Coag Factor VIII Assay Inhib Scrn,P	No	No
FACTV	Coag Factor V Assay, P	Yes	No
F_7	Coag Factor VII Assay, P	Yes	No
F_9	Coag Factor IX Assay, P	Yes	No
F_10	Coag Factor X Assay, P	Yes	No
F_11	Coag Factor XI Assay, P	Yes	No
F_12	Coag Factor XII Assay, P	Yes	No
F8A	Coag Factor VIII Activity Assay, P	Yes	No
RTSC	Reptilase Time, P	Yes	No
F_2	Coag Factor II Assay, P	Yes	No

PNP	Platelet Neutralization Procedure	No	No
PTMSC	PT Mix 1:1	No	No
APMSC	APTT Mix 1:1	No	No
DRV2	DRVVT Mix	No	No
DRV3	DRVVT Confirmation	No	No
F5_IS	Factor V Inhib Scrn	No	No
F9_IS	Factor IX Inhib Scrn	No	No
F2_IS	Factor II Inhib Scrn	No	No
F7_IS	Factor VII Inhib Scrn	No	No
10_IS	Factor X Inhib Scrn	No	No
11_IS	Factor XI Inhib Scrn	No	No
PTFIB	PT-Fibrinogen, P	No	No
SOLFM	Soluble Fibrin Monomer	No	No
CH9	Chromogenic FIX, P	Yes	No
CHF8	Chromogenic FVIII, P	Yes	No
HEXLA	HEX LA, P	No	No

Testing Algorithm

Initial testing includes prothrombin time (PT), activated partial thromboplastin time (aPTT), dilute Russell's viper venom time (dRVVT), thrombin time (bovine), fibrinogen, D-dimer, and prolonged clot time interpretation.

If the PT is greater than 13.9 seconds, then the PT mix will be performed at an additional charge.

If the aPTT is greater or equal to 38 seconds, then the aPTT mix will be performed at an additional charge.

If the aPTT mix is greater or equal to 38 seconds and thrombin time is less than 35.0 seconds (no evidence of heparin), then the platelet neutralization procedure will be performed at an additional charge.

If the dRVVT ratio is greater or equal to 1.20, then the dRVVT mix and dRVVT confirmation will be performed at an additional charge.

If the thrombin time is greater or equal to 25.0 seconds, then the reptilase time will be performed at an additional charge.

If fibrinogen is less than 150 mg/dL or clinically indicated, then the PT-fibrinogen will be performed at an additional charge.

If D-dimer is greater than 500 ng/mL fibrinogen equivalent units, then soluble fibrin monomer testing will be performed at an additional charge.

If the PT, aPTT, or aRVVT are prolonged, then coagulation factor assays may be performed at an additional charge.

If a factor assay result is below the normal range, the appropriate factor inhibitor screen may be performed along with

the Bethesda titrating assay, at an additional charge, if inhibitor screen is positive.

If appropriate, hexagonal lupus anticoagulant will be performed at an additional charge to clarify significant abnormalities in the screen test results.

Special Instructions

- [Coagulation Guidelines for Specimen Handling and Processing](#)
- [Coagulation Patient Information](#)
- [Coagulation Profile Comparison](#)

Method Name

ARPI: Medical Interpretation

PTSC, APTSC, DRV1, TTSC, GBETH, 5BETH, 8BETH, 9BETH, F8IS, FACTV, F_2, F_7, F_9, F_10, F_11, F_12, F8A, RTSC, PNP, APMSC, PTMSC, PTFIB, DRV2, DRV3: Optical Clot-Based

CLFIB: Clauss

DIMER, SOLFM: Latex Immunoassay (LIA)

CH9, CHF8: Chromogenic

HEXLA: Spectrophotometry

NY State Available

Yes

Specimen**Specimen Type**

Plasma Na Cit

Ordering Guidance

Multiple coagulation profile tests are available. See [Coagulation Profile Comparison](#) for testing that is performed with each profile.

Shipping Instructions

Send the 5 aliquots in the same shipping container.

Necessary Information

Note if patient is currently receiving heparin, warfarin or any medication affecting coagulation.

Specimen Required

Specimen Type: Platelet-poor plasma

Patient Preparation:

1. Patient **should not** be receiving anticoagulant treatment (eg, warfarin, heparin). If not possible for medical reasons, note on request.

a. If medically feasible, for 4 to 6 hours before specimen collection, **do not** administer intravenous heparin.

b. If medically feasible, for 10 to 14 days before specimen collection, **do not** administer subcutaneous heparin or

warfarin.

2. Patient **should not** be receiving fibrinolytic agents (streptokinase, urokinase, tissue plasminogen activator [tPA]).
3. It is recommended that specimens be collected pretransfusion. If patient has been transfused, **a specimen should not be collected for 48 hours.**

Collection Container/Tube: Light-blue top (3.2% sodium citrate)

Submission Container/Tube: Plastic vial

Specimen Volume: 5 mL Platelet-poor plasma in 5 plastic vials, each containing 1 mL

Collection Instructions:

1. Specimen must be collected prior to factor replacement therapy.
2. For complete instructions, see [Coagulation Guidelines for Specimen Handling and Processing](#).
3. Centrifuge, transfer all plasma into a plastic vial, and centrifuge plasma again.
4. Aliquot plasma (1-2 mL per aliquot) into 5 separate plastic vials leaving 0.25 mL in the bottom of centrifuged vial.
5. Immediately freeze plasma (no longer than 4 hours after collection) at -20 degrees C or, ideally, -40 degrees C or below.

Additional Information:

1. Double-centrifuged specimen is critical for accurate results as platelet contamination may cause spurious results.
2. Each coagulation assay requested should have its own vial.

Forms

1. [Coagulation Patient Information](#) (T675)
2. If not ordering electronically, complete, print, and send a [Coagulation Test Request](#) (T753) with the specimen.

Specimen Minimum Volume

Platelet-poor plasma: 4 plastic vials, each containing 1 mL

Reject Due To

Gross hemolysis	Reject
Gross lipemia	Reject
Gross icterus	Reject

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Plasma Na Cit	Frozen	14 days	

Clinical & Interpretive

Clinical Information

When coagulation screening tests are performed to verify normal function of the coagulation system (eg, preoperative, routine examination), they sometimes indicate an abnormality that may be unexplained (ie, prolonged clotting times). This consultation provides validation of the prolongation and as comprehensive a workup as needed to define the abnormality.

Possibilities for a cause of prolongation include:

- Artifactual due to high hematocrit (dilution of specimen by anticoagulant if patient hematocrit is 55% or greater)
- Factor deficiencies, congenital or acquired
- Factor inhibitors eg, factor VIII inhibitors (bleeding disorder)
- Lupus anticoagulant (risk for thrombosis or recurrent miscarriage)
- Anticoagulant drug effect eg, (including warfarin [Jantoven], oral anti-Xa inhibitors, oral direct thrombin inhibitors), heparin.

Reference Values

An interpretive report will be provided.

PROTHROMBIN TIME (PT):

[Prothrombin time: 9.4-12.5 seconds](#)

International normalized ratio (INR):

0.9-1.1

Standard intensity warfarin therapeutic range: 2.0-3.0

High intensity warfarin therapeutic range: 2.5-3.5

ACTIVATED PARTIAL THROMBOPLASTIN TIME (aPTT):

25-37 seconds

The activated partial thromboplastin time (aPTT) may be 35% longer in full-term newborns that reach adult reference range by age 3 months and twice the adult upper limit in premature infants reaching adult reference range by age 6 months.

DILUTE RUSSELL'S VIPER VENOM TIME (dRVVT):

<1.20

Normal ranges for children: Not clearly established but similar to normal ranges for adults, except for newborn infants whose results may not reach adult values until age 3 to 6 months.

THROMBIN TIME (BOVINE):

15.8-24.9 seconds

FIBRINOGEN, CLAUSS:

Males: 200-500 mg/dL

Females: 200-500 mg/dL

In normal full-term newborns and in healthy premature infants (30-36 weeks gestation) fibrinogen is near adult levels (>150) and reaches adult levels by less than 21 days postnatal.

D-DIMER:

< or =500 ng/mL Fibrinogen Equivalent Units (FEU)

D-dimer values < or =500 ng/mL FEU may be used in conjunction with clinical pretest probability to exclude deep vein thrombosis (DVT) and pulmonary embolism (PE).

GENERAL FACTOR BETHESDA UNITS:

< or =0.5 Bethesda Units

FACTOR V BETHESDA UNITS:

< or =0.5 Bethesda Units

FACTOR VIII BETHESDA UNITS:

< or =0.5 Bethesda Units

FACTOR IX BETHESDA UNITS:

< or =0.4 Bethesda Units

COAGULATION FACTOR VIII INHIBITOR:

Negative

COAGULATION FACTOR V ACTIVITY ASSAY:

>1 month: 70%-165%

<1 month: Normal, full-term and premature newborn infants may have mildly decreased levels (> or =30% to 35%) which reach adult levels within 21 days postnatal.

COAGULATION FACTOR VII ACTIVITY ASSAY:

Adults: 65-180%

Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =20%) which increase within the first postnatal week but may not reach adult levels for > or =180 days postnatal.*

COAGULATION FACTOR IX ACTIVITY ASSAY:

< or =6 months: Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =20%), which may not reach adult levels for 180 or more days postnatal.* (Literature derived)

>6 months: 65-140%

COAGULATION FACTOR X ACTIVITY ASSAY:

Adults: 70-150%

Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =15-20%), which may not reach adult levels for 180 or more days postnatal.*

COAGULATION FACTOR XI ACTIVITY ASSAY:

Adults: 55-150%

Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =10%), which may not reach adult levels [for 180 or more days postnatal.*](#)

COAGULATION FACTOR XII ACTIVITY ASSAY:

Adults: 55-180%

Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =15% to 20%), which may not reach adult levels for 180 or more days postnatal.*

COAGULATION FACTOR VIII ACTIVITY ASSAY:

Adults: 55-200%

Normal, full-term newborn infants or healthy premature infants typically have levels greater than or equal to 40%.*

REPTILASE TIME:

14.0-23.9 Seconds

COAGULATION FACTOR II ACTIVITY ASSAY

Adults: 75-145%

Normal, full-term newborn infants or healthy premature infants may have decreased levels (> or =25%) which may remain below adult levels for > or =180 days postnatal.*

PLATELET NEUTRALIZATION PROCEDURE:

An interpretive report will be provided.

PROTHROMBIN TIME MIX 1:1:

9.4-12.5 seconds

ACTIVATED PARTIAL THROMBOPLASTIN TIME (aPTT) MIX 1:1:

25-37 seconds

DILUTE RUSSELL'S VIPER VENOM TIME (dRVVT) MIX

<1.20

Normal ranges for children: Not clearly established but similar to normal ranges for adults, except for newborn infants whose results may not reach adult values until age 3 to 6 months.

DILUTE RUSSELL'S VIPER VENOM TIME (dRVVT) CONFIRMATION:

<1.20

Normal ranges for children: Not clearly established but similar to normal ranges for adults, except for newborn infants whose results may not reach adult values until age 3 to 6 months.

FACTOR V INHIBITOR:

Negative

FACTOR IX INHIBITOR:

Negative

FACTOR II INHIBITOR:

Negative

FACTOR VII INHIBITOR:

Negative

FACTOR X INHIBITOR SCREEN:

Negative

FACTOR XI INHIBITOR:

Negative

PT-FIBRINOGEN:

261-595 mg/dL

In normal full-term newborns and in healthy premature infants (30-36 weeks gestation), fibrinogen is near adult levels (>150) and remains at adult levels throughout childhood.

SOLUBLE FIBRIN MONOMER:

< or =8 mcg/mL

CHROMOGENIC FACTOR IX ACTIVITY ASSAY:

65-140%

Chromogenic factor IX activity generally correlates with the one-stage FIX activity. In full term/premature neonates, infants, children, and adolescents the one-stage FIX activity* is similar to adults. However, no similar data for chromogenic FIX activity are available.**

CHROMOGENIC FACTOR VIII ACTIVITY ASSAY:

55.0-200.0%

Chromogenic factor VIII activity generally correlates with the one-stage FVIII activity. In full term/premature neonates, infants, children, and adolescents the one-stage FVIII activity* is similar to adults. However, no similar data for chromogenic FVIII activity are available.**

HEXAGONAL LUPUS ANTICOAGULANT:

<13 seconds

*See Pediatric Hemostasis References section in [Coagulation Guidelines for Specimen Handling and Processing](#)

**Appel IM, Grimminck B, Geerts J, Stigter R, Cnossen MH, Beishuizen A. Age dependency of coagulation parameters during childhood and puberty. J Thromb Haemost. 2012;10[11]:2254-2263

Interpretation

An interpretive report will be provided when testing is completed, noting a presence or absence of a prolonged bleeding disease state.

Cautions

If the patient's hematocrit is 55% or greater, the volume of citrate anticoagulant should be adjusted prior to submitting the specimen for analysis to avoid dilution of plasma by anticoagulant.(1)

For optimal results, the patient should not be receiving oral vitamin K inhibitor (eg, warfarin), heparin, low-molecular weight heparin, hirudin (Refludan), argatroban, or fibrinolytic agents (eg, streptokinase, tissue plasminogen activator). If necessary, testing may be performed on patients receiving these treatments. Medications affecting coagulation parameters must be noted on requisition for accurate interpretation of results. Treatment with heparin causes false-positive results of in vitro coagulation testing for lupus anticoagulant. Coumadin treatment may impair ability to detect the more subtle varieties of lupus-like anticoagulants.

Performance**Method Description**

Prothrombin time:

The prothrombin time (PT) assay is performed on the Instrumentation Laboratory ACL TOP. Patient sample is incubated and combined with a PT reagent containing recombinant human tissue factor, synthetic phospholipids, calcium chloride, polybrene, and buffer. The tissue thromboplastin-factor VII/VIIa complex activates factor X. Activated factor X (factor Xa) forms a complex with factor Va, calcium, and phospholipid to activate factor II (prothrombin) to thrombin. Thrombin then acts on fibrinogen (factor I) to form fibrin which clots, the time to clot formation is measured optically using a wavelength of 671 nm providing the assay endpoint (the "prothrombin time").(Package insert: HemosIL RecombiPlasTin 2G. Instrumentation Laboratory Company; R0, 03/2019)

Activated Partial Thromboplastin Time:

The activated partial thromboplastin time (aPTT) assay is performed on the Instrumentation Laboratory ACL TOP. Patient sample is combined and incubated with an aPTT reagent containing phospholipid, a negatively charged contact factor activator, and buffer. After a specified incubation time, calcium is added to trigger the coagulation process in the mixture. Subsequently, the time to clot formation is measured optically using a wavelength of 671 nm. Mixing studies (APMSC / Activated Partial Thromboplastin Time [APTT] Mix 1:1, Plasma) using normal pooled plasma are performed on samples with a prolonged aPTT to assist in discriminating between factor deficiency states and coagulation inhibitors unless further testing is not indicated.(Package insert: HemosIL SynthASil. Instrumentation Laboratory Company; R11, 06/2017)

Dilute Russell's Viper Venom Time:

The dilute Russell's viper venom time (dRVVT) screening assay is performed on the Beckman Coulter ACL TOP. Patient sample is incubated for a specified time, then combined with a dRVVT screening reagent containing Russell's viper venom, phospholipids, heparin neutralizing agents, calcium, buffers, and stabilizers to trigger the coagulation process. Subsequently, the time to clot formation is measured optically using a wavelength of 671 nm. The patient dRVVT screening clotting time is normalized by dividing the patient result by the mean dRVVT screening clotting time of normal pooled plasma to yield a ratio (dRVVT screen ratio).(Package insert: LA CHECK DRVVT. Precision Biologic; R14, 03/2012)

Thrombin Time:

The thrombin time assay is performed on the Instrumentation Laboratory ACL TOP. Patient sample is combined with a bovine thrombin reagent containing bovine albumin, calcium chloride, and buffer immediately triggering the coagulation process in the mixture. Time to clot formation is measured optically using a wavelength of 671 nm.(Package insert:

HemosIL Thrombin Time. Instrumentation Laboratory Company; R1, 12/2018)

Fibrinogen, Clauss assay:

The Clauss fibrinogen assay is performed using the HemosIL Fibrinogen-C kit on the Instrumentation Laboratory ACL TOP. Patient sample, containing fibrinogen, is mixed with reagent containing excess thrombin. The excess thrombin converts the fibrinogen in the patient sample to fibrin. The amount of time it takes to form a clot is inversely proportional to the amount of fibrinogen present in the patient sample. (Package insert: HemosIL Fibrinogen-C. Instrumentation Laboratory Company; R7, 06/2017)

D-Dimer:

The D-dimer assay is performed using the HemosIL D-Dimer HS 500 kit on the Instrumentation Laboratory ACL TOP instrument. D-dimer is assayed in plasma by adding polystyrene latex particles coated with monoclonal antibodies specific for D-dimer domain. The latex particles agglutinate in the presence of soluble fibrin degradation products containing the D-dimer domain. The degree of agglutination is directly proportional to the concentration of D-dimer in the sample and is determined by measuring the decrease of transmitted light caused by the aggregates (turbidimetric immunoassay). (Package insert: HemosIL D-Dimer HS 500. Instrumentation Laboratory Company; 04/2018)
