

## Overview

### Useful For

Establishing a diagnosis of lymphoplasmacytic lymphoma/Waldenstrom macroglobulinemia (LPL/WM)

Helping distinguish LPL/WM low-grade B-cell lymphoma from other subtypes

Aiding in the prognosis and clinical management of lymphoplasmacytic lymphoma/Waldenstrom macroglobulinemia

### Reflex Tests

| Test Id | Reporting Name               | Available Separately          | Always Performed |
|---------|------------------------------|-------------------------------|------------------|
| CXCFX   | CXCR4, Gene Mutation, Reflex | Yes, (order CXLPL), Bill Only | No               |

### Testing Algorithm

The algorithm starts with the sensitive *MYD88* L265P testing by allele-specific polymerase chain reaction. If a *MYD88* L265P variant is detected, additional *CXCR4* testing will be performed. If a *MYD88* L265P variant is not detected, the algorithm ends, and no further testing is necessary.

### Special Instructions

- [Hematopathology Patient Information](#)

### Highlights

This test offers highly sensitive detection of the well-characterized hotspot variants c.1013C->G/A, p.S338X and routine Sanger sequencing for other variants in the C-terminus region.

### Method Name

Allele-Specific Polymerase Chain Reaction (AS-PCR)/Bridged Nucleic Acids (BNA) Clamp Sanger Sequencing/Routine Sanger Sequencing  
(BNAClamp is utilized pursuant to a license agreement with BNA Inc.)

### NY State Available

Yes

## Specimen

### Specimen Type

Varies

**Shipping Instructions**

**Whole blood or bone marrow specimens must arrive within 10 days of collection.**

**Necessary Information**

**The following information is required:**

1. Pertinent clinical history
2. Clinical or morphologic suspicion
3. Date and time of collection
4. Specimen source

**Specimen Required**

**Submit only 1 of the following specimens:**

**Preferred:**

**Specimen Type:** Bone marrow

**Container/Tube:**

**Preferred:** Lavender top (EDTA)

**Acceptable:** Yellow top (ACD)

**Specimen Volume:** 2 mL

**Collection Instructions:**

1. Invert several times to mix bone marrow
2. Send bone marrow specimen in original tube. **Do not aliquot.**
3. Label specimen as bone marrow

**Specimen Stability Information:** Ambient (preferred)/Refrigerated

**Specimen Type:** Paraffin-embedded tissue

**Container/Tube:** Paraffin block

**Specimen Stability:** Ambient

**Specimen Type:** Paraffin-embedded bone marrow aspirate clot

**Container/Tube:** Paraffin block

**Specimen Stability:** Ambient

**Specimen Type:** Tissue

**Slides:** Unstained slides

**Specimen Volume:** 10 to 20 slides

**Additional Information:** Tissue must demonstrate involvement by a hematologic neoplasm (eg, acute myelocytic leukemia), not solid tumors.

**Specimen Stability Information:** Ambient

**Acceptable:**

**Specimen Type:** Whole blood

**Container/Tube:****Preferred:** Lavender top (EDTA)**Acceptable:** Yellow top (ACD)**Specimen Volume:** 3 mL**Collection Instructions:**

1. Invert several times to mix blood
2. Send whole blood specimen in original tube. **Do not aliquot.**
3. Label specimen as blood

**Specimen Stability Information:** Ambient (preferred)/Refrigerated**Specimen Type:** Extracted DNA**Container/Tube:** 1.5- to 2-mL tube with indication of volume and concentration of the DNA**Specimen Volume:** Entire specimen**Collection Instructions:** Label specimen as extracted DNA and list the specimen source. Include indication of volume and concentration of the DNA.**Specimen Stability Information:** Frozen (preferred)/Refrigerated/Ambient**Forms**

1. [Hematopathology Patient Information](#) (T676)
2. If not ordering electronically, complete, print, and send a [Hematopathology/Cytogenetics Test Request](#) (T726) with the specimen.

**Specimen Minimum Volume**

Whole blood, Bone marrow: 1 mL

Extracted DNA: 50 mcL with a concentration of at least 20 nanograms per mcL

Other specimen types: See Specimen Required

**Reject Due To**

|   |        |
|---|--------|
| Gross hemolysis   | Reject |
| B5-fixed tissues<br>Decalcified bone marrow biopsies<br>Methanol-acetic acid<br>(MAA)-fixed pellets<br>Paraffin shavings<br>Frozen tissue | Reject |

|                                |  |
|--------------------------------|--|
| Moderately to severely clotted |  |
|--------------------------------|--|

**Specimen Stability Information**

| Specimen Type | Temperature | Time    | Special Container |
|---------------|-------------|---------|-------------------|
| Varies        | Varies      | 10 days |                   |

**Clinical & Interpretive****Clinical Information**

The *MYD88* L265P abnormality is highly associated (>90%) with the pathologic diagnosis of lymphoplasmacytic lymphoma and the clinical syndrome of Waldenstrom macroglobulinemia (LPL/WM), particularly in the setting of an elevated IgM serum monoclonal paraprotein.

*CXCR4* mutations are identified in approximately 30% to 40% of LPL/WM patients and are almost always in association with *MYD88* L265P, which is highly prevalent in this neoplasm. The status of *CXCR4* mutations in the context of *MYD88* L265P is clinically relevant as important determinants of clinical presentation, overall survival and therapeutic response to ibrutinib. A *MYD88*-L265P/*CXCR4*-WHIM (C-terminus nonsense/frameshift variants) molecular signature is associated with intermediate to high bone marrow disease burden and serum IgM levels, less adenopathy, and intermediate response to ibrutinib in previously treated patients. A *MYD88*-L265P/*CXCR4*-WT (wildtype) molecular signature is associated with intermediate bone marrow disease burden and serum IgM levels, more adenopathy, and highest response to ibrutinib in previously treated patients. A *MYD88*-WT/*CXCR4*-WT molecular signature is associated with inferior overall survival, lower response to ibrutinib therapy in previously treated patients, and lower bone marrow disease burden in comparison to those harboring a *MYD88*-L265 variant.

**Reference Values**

*MYD88* L265P: Mutation present or absent based on expected variant polymerase chain reaction product size for the *MYD88* gene (NCBI accession NM\_002468.4).

*CXCR4*: Mutation present or absent in the test region c. 898-1059 (amino acids 300-353) of the *CXCR4* gene (NCBI NM\_003467.2, GRCh37).

**Interpretation**

Mutation present or not detected; an interpretive report will be issued.

**Cautions**

This *MYD88* test is a targeted assay and will not detect any alteration at the *MYD88* codon 265 that does not result in the L>P (leucine to proline) amino acid change. It will also not detect additional *MYD88* variants, including insertion or deletion events. The analytical sensitivity of the assay (1% *MYD88* L265P in a wildtype background) can be affected by a variety of factors, including biologic availability (ie, tumor burden), fixation of paraffin-embedded specimens, or

---

nonspecific polymerase chain reaction (PCR) interferences. Rare cases of lymphoplasmacytic lymphoma/Waldenstrom macroglobulinemia (LPL/WM) have been reported lacking the *MYD88* L265P abnormality, so a negative result would not completely exclude this diagnosis but would make the possibility of LPL/WM more unlikely.

The reflexed test is a targeted assay for the C-terminal end of the *CXCR4* gene only. It examines c.898-1059 of the *CXCR4* gene (NCBI NM\_003467.2 GRCh37) and does not detect variants outside this region. A 1% analytical sensitivity was established at 50 ng DNA input for the hotspot mutations c.1013C>G/A only, which uses bridged nucleic acids (BNA) clamped Sanger sequencing, and DNA that does not meet the established criteria can lead to false-negative results. In the extremely rare event that a rare benign variant (ie, polymorphism), insertion, or deletion occurs at the Sanger sequencing primer binding sites, in cis with a c.1013C>G/A, data can yield a failed result. Routine Sanger sequencing is used to interrogate other mutations in the tested region with a 15% to 20% analytical sensitivity. The analytical sensitivity of the assay can be affected by a variety of factors, including biologic availability (ie, tumor burden), fixation of paraffin-embedded specimens, rare benign variants, insertions, or deletions at the primer binding sites or nonspecific PCR interferences.

## Performance

### Method Description

Extracted DNA from the clinical specimen is subjected to allele-specific polymerase chain reaction (PCR) using *MYD88* exon 5 primers that simultaneously amplify both a wild-type sequence fragment and a fragment containing the specific nucleotide change resulting in L265P if present. PCR products are visualized by capillary electrophoresis and the presence of mutated and wildtype amplicons is determined according to the expected specific PCR product sizes.(Unpublished Mayo method)

The C-terminal end of *CXCR4* (NM\_003467.2, c. 898-1059) is amplified from extracted genomic DNA by PCR, followed by Sanger sequencing and capillary electrophoresis analysis. Review of the sequence data is performed using a combination of automated calls and manual inspection. (Unpublished Mayo method)

The hotspot mutations c.1013C>G/A (p.S338X) are examined using bridged nucleic acids clamped Sanger sequencing with an analytic sensitivity of 1%. All other genetic mutations in the test region are examined by routine Sanger sequencing with an analytic sensitivity of 15% to 20%.(Unpublished Mayo method)

### PDF Report

No

### Day(s) Performed

Monday through Friday

### Report Available

7 to 10 days

### Specimen Retention Time

Blood/Bone marrow: 2 weeks; Extracted DNA: 3 months

### Performing Laboratory Location

Mayo Clinic Laboratories - Rochester Main Campus

## Fees & Codes

### Fees

Lymphoplasmacytic Lymphoma/Waldenstrom Macroglobulinemia, MYD88 L265P with Reflex to CXCR4, Varies

- Authorized users can sign in to [Test Prices](#) for detailed fee information.
- Clients without access to Test Prices can contact [Customer Service](#) 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact [Customer Service](#).

**Test Classification**

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.

**CPT Code Information**

81305
