

# Test Definition: GBACC

Gamma-Amino Butyric Acid Type A (GABA-A)  
Receptor Antibody, Cell-Binding Assay, Spinal  
Fluid

## Overview

### Useful For

Evaluating patients with suspected autoimmune encephalitis and autoimmune epilepsy using spinal fluid specimens

### Method Name

Cell-Binding Assay (CBA)

### NY State Available

Yes

## Specimen

### Specimen Type

CSF

### Specimen Required

**Container/Tube:** Sterile vial

**Preferred:** Collection vial number 1

**Acceptable:** Any collection vial

**Specimen Volume:** 1 mL

### Forms

[If not ordering electronically, complete, print, and send a Neurology Specialty Testing Client Test Request \(T732\)](#) with the specimen.

### Specimen Minimum Volume

0.4 mL

### Reject Due To

Gross hemolysis	Reject
Gross lipemia	Reject
Gross icterus	Reject

### Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
---------------	-------------	------	-------------------

# Test Definition: GBACC

Gamma-Amino Butyric Acid Type A (GABA-A)  
Receptor Antibody, Cell-Binding Assay, Spinal  
Fluid

CSF	Refrigerated (preferred)	28 days	
	Ambient	72 hours	
	Frozen	28 days	

## Clinical & Interpretive

### Clinical Information

Gamma-amino butyric acid type A (GABA-A) receptor autoantibodies are highly predictive of GABA-A receptor autoimmune encephalitis. Patients who are seropositive for GABA-A receptor encephalitis have characteristic clinical-radiologic presentations including frequent seizures and multifocal lesions in the white matter. The majority of patients are treatable with immunotherapy.

### Reference Values

Negative

### Interpretation

Seropositivity for gamma-amino butyric acid type A receptor autoantibodies supports the clinical diagnosis of autoimmune encephalitis with neurological presentations including seizures and multifocal lesions in the white matter. A search for thymoma cancer and a trial of immunotherapy should be considered.

### Cautions

Negative results do not exclude the diagnosis of autoimmune encephalitis. Only 2% of autoimmune encephalitis cases are associated with autoantibodies against gamma-amino butyric acid type A receptor.

## Performance

### Method Description

Patient specimen is applied to a composite slide containing transfected and nontransfected EU90 cells. After incubation and washing, fluorescein-conjugated goat-antihuman IgG is applied to detect the presence of patient IgG binding.(Package insert: IIFT: Neurology Mosaics, Instructions for the indirect immunofluorescence test.
