

Volatile Screen, Chain of Custody, Random, Urine

#### Overview

#### **Useful For**

Detecting the presence of acetone, methanol, isopropanol, or ethanol in urine with subsequent quantitation

Providing chain of custody for when the results of testing could be used in a court of law. Its purpose is to protect the rights of the individual contributing the specimen by demonstrating that it was always under the control of personnel involved with testing the specimen; this control implies that the opportunity for specimen tampering would be limited.

#### **Additional Tests**

Test Id	Reporting Name	Available Separately	Always Performed
СОСН	Chain of Custody	No	Yes
	Processing		

### **Testing Algorithm**

This test includes analysis of methanol, ethanol, isopropanol, and acetone.

#### **Method Name**

Headspace Gas Chromatography Flame Ionization Detector (HSGC-FID)

## **NY State Available**

Yes

## **Specimen**

### Specimen Type

Urine

# **Ordering Guidance**

For best clinical correlation, the recommended test is VLTBX / Volatile Screen, Chain of Custody, Blood.

### Additional Testing Requirements

If urine creatinine is required or adulteration of the sample is suspected, order ADLTX / Adulterants Survey, Chain of Custody, Random, Urine in addition to this test.

# **Specimen Required**

**Supplies:** Chain-of-Custody Kit (T282)

**Container/Tube:** Chain-of-Custody Kit containing the specimen containers, seals, and documentation required.

Specimen Volume: 10 mL

Volatile Screen, Chain of Custody, Random, Urine

**Collection Instructions:** Collect a random urine specimen using the container provided, seal, and submit with the associated documentation to satisfy the legal requirements for chain of custody testing.

#### **Forms**

- 1. Chain of Custody Request is included in the Chain-of-Custody Kit (T282).
- 2. If not ordering electronically, complete, print, and send a Therapeutics Test Request (T831) with the specimen.

## Specimen Minimum Volume

1 mL

## **Reject Due To**

All specimens will be evaluated at Mayo Clinic Laboratories for test suitability.

### **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Urine	Refrigerated (preferred)	14 days	
	Ambient	24 hours	
	Frozen	28 days	

# **Clinical & Interpretive**

#### **Clinical Information**

Urine provides a medium for easy screening for methanol, ethanol, isopropanol, and acetone.

Chain of custody is required whenever the results of testing could be used in a court of law. Chain of custody is a record of the disposition of a specimen to document the individuals that collected it, handled it, and performed the analysis. When a specimen is submitted in this manner, analysis will be performed in such a way that it will withstand regular court scrutiny.

# **Reference Values**

Methanol

Not detected (Positive results are quantitated.)

Cutoff concentration: 10 mg/dL Toxic concentration: > or =10 mg/dL

Ethanol

Not detected (Positive results are quantitated.)

Cutoff concentration: 10 mg/dL

Isopropanol

Not detected (Positive results are quantitated.)

Cutoff concentration: 10 mg/dL

Volatile Screen, Chain of Custody, Random, Urine

Toxic concentration: > or =10 mg/dL

Acetone

Not detected (Positive results are quantitated.)

Cutoff concentration: 10 mg/dL Toxic concentration: > or =10 mg/dL

### Interpretation

#### Methanol:

The presence of methanol indicates exposure that may result in intoxication, central nervous system (CNS) depression, and metabolic acidosis. Ingestion of methanol can be fatal if patients do not receive immediate medical treatment.

#### Ethanol:

The presence of ethanol indicates exposure that may result in intoxication, CNS depression, and metabolic acidosis.

#### Isopropanol:

The presence of isopropanol indicates exposure that may result in intoxication and CNS depression. Ingestion of isopropanol can be fatal if patients do not receive immediate medical treatment.

#### Acetone:

The presence of acetone may indicate exposure to acetone; it is also a metabolite of isopropanol and may be detected during ketoacidosis.

#### **Cautions**

Quantitation of acetone, methanol, isopropanol, or ethanol in urine correlates poorly with degree of intoxication.

#### **Performance**

#### **Method Description**

Samples are analyzed and quantified by headspace gas chromatography with flame ionization detection. (Baselt RC. Disposition of Toxic Drugs and Chemicals in Man. 10th ed. Biomedical Publications; 2014:2211)

# **PDF Report**

No

### Day(s) Performed

Volatile Screen, Chain of Custody, Random, Urine

Monday through Saturday

### **Report Available**

1 to 2 days

### **Specimen Retention Time**

2 weeks

# **Performing Laboratory Location**

Mayo Clinic Laboratories - Rochester Superior Drive

#### **Fees & Codes**

#### **Fees**

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact <u>Customer Service</u>.

#### **Test Classification**

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.

# **CPT Code Information**

80320

G0480 (if appropriate)
