

Legionella species, Molecular Detection, PCR, Varies

#### Overview

#### **Useful For**

Sensitive and rapid diagnosis of pneumonia caused by Legionella species

The assay is **not recommended** as a test of cure because bacteria nucleic acids may persist after successful treatment.

#### **Method Name**

Rapid Polymerase Chain Reaction (PCR)

#### **NY State Available**

Yes

## Specimen

## **Specimen Type**

Varies

### **Necessary Information**

Specimen source is required.

## **Specimen Required**

The high sensitivity of amplification by polymerase chain reaction requires the specimen to be processed in an environment in which contamination of the specimen by *Legionella* DNA is unlikely.

Specimen Type: Lower respiratory

Sources: Bronchoalveolar lavage, bronchial aspirate/brushing/lavage/washing, tracheal/endotracheal

secretions/aspirate, sputum

Container/Tube: Sterile container

Specimen Volume: 1 mL

**Specimen Type:** Fresh tissue or biopsy

Sources: Lung, pleura, heart valve, pericardium

Container/Tube: Sterile container

**Specimen Volume:** Entire collection or 5 mm(3) - approximately the size of a pencil eraser **Collection Instructions:** Aseptically collect a 1 to 2 cm(3) piece of tissue whenever possible

Specimen type: Fluid

Sources: Pericardial, pleural, chest, chest tube drainage, thoracentesis, empyema

Container/Tube: Sterile container

Legionella species, Molecular Detection, PCR, Varies

Specimen Volume: 1 mL

#### **Forms**

If not ordering electronically, complete, print, and send a Microbiology Test Request (T244) with the specimen.

## **Specimen Minimum Volume**

See Specimen Required

## **Reject Due To**

Tissue in	Reject
formalin,	
formaldehyde,	
or acetone	
Formalin-fixed	
paraffin-embe	
dded (FFPE)	
block	

## **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Varies	Refrigerated (preferred)	7 days	
	Frozen	7 days	

## **Clinical & Interpretive**

## **Clinical Information**

Legionnaires disease was first recognized during a pneumonia outbreak at the Legionnaires convention in Philadelphia in 1976. Investigators with the Centers for Disease Control and Prevention isolated a novel, gram-negative bacillus, later named *Legionella pneumophila*. It is now widely recognized that *L pneumophila* (and other members of the genus *Legionella*) cause Legionnaires disease.

#### **Reference Values**

Not applicable

#### Interpretation

A positive polymerase chain reaction (PCR) result for the presence of a specific sequence found within the *Legionella* 5S ribosomal RNA gene indicates the presence of a *Legionella* species DNA, which may be due to *Legionella* infection or environmental/water *Legionella* DNA in the specimen.

A negative PCR result indicates the absence of detectable *Legionella* DNA in the specimen but does not rule-out legionellosis as false-negative results may occur due to inhibition of PCR, sequence variability underlying the primers and probes, or the presence of *Legionella* species in quantities less than the limit of detection of the assay.

Legionella species, Molecular Detection, PCR, Varies

#### **Cautions**

This assay does not differentiate between the *Legionella* species. False-positive results are theoretically possible if patient specimens are contaminated with *Legionella* DNA, which may occur since *Legionella* species are environmental organisms present in aquatic environments.

The following uncommonly encountered species of *Legionella* are not detected by this assay: *Legionella* birmhinghamensis and *Legionella* feeleii.

## **Supportive Data**

In a Mayo Clinic study, 153 archived respiratory specimens previously tested for *Legionella* species by direct fluorescence antibody (DFA) testing were extracted and tested using this polymerase chain reaction (PCR) method. The PCR assay was 100% sensitive and 99.3% specific, in comparison to DFA. Additionally, 30 lung tissues and 30 pleural fluids were spiked with 3 of the most frequently isolated *Legionella* species. Spiking studies showed similar analytical sensitivity for PCR and the DFA method. The analytical sensitivity was less than 50 targets/20 microliter reaction. No cross-reactivity was observed when tested on a panel of respiratory pathogens or normal flora bacteria of the upper respiratory tract. Fifteen serogroups of *Legionella pneumophila* (*L pneumophila* serogroups 1-14, 15/16) and 15 additional *Legionella* species; (*Fluoribacter* [*Legionella*] bozemanae, *Fluoribacter* [*Legionella*] dumoffii, *Legionella* gormanii, *Legionella jordanis*, *Legionella longbeachae*, *Legionella micdadei*, *Legionella oakridgensis*, *Legionella hackeliae*, *Legionella maceachernii*, *Legionella parisiensis*, *Legionella sainthelensi*, *Legionella cincinnatiensis*, *Legionella lansingensis*, *Legionella rubrilucens*, and *Legionella wadsworthi*) included in the panel were detected with the PCR method.

## Performance

#### **Method Description**

This method employs a target-specific detection system using fluorescent resonance energy transfer (FRET) hybridization probes designed for a specific sequence found within the *Legionella* 5S ribosomal RNA gene. The LightCycler (LC) instrument amplifies and monitors target nucleic acid sequences by fluorescence during polymerase chain rection (PCR) cycling. This is an automated PCR system that can rapidly detect amplified product development through stringent air-controlled temperature cycling. The detection of amplified products is based on the FRET principle. For FRET product detection, a hybridization probe with a donor fluorophore, fluorescein, on the 3' end is excited by an external light source, which emits light that is absorbed by a second hybridization probed with an acceptor fluorophore, LC-Red 640, on the 5' end. The acceptor fluorophore then emits light of a different wavelength that can be measured

Legionella species, Molecular Detection, PCR, Varies

with a signal that is proportional to the amount of specific PCR product. The detection process is completed in a closed system. (Cunningham SA, Sloan LM, Uhl JA, et al. ## **PDF Report**

No

## Day(s) Performed

Monday through Sunday

## Report Available

3 days

#### **Specimen Retention Time**

7 days

## **Performing Laboratory Location**

Mayo Clinic Laboratories - Rochester Main Campus

#### **Fees & Codes**

#### **Fees**

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact <u>Customer Service</u>.

## **Test Classification**

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.
