Testing Algorithm

If clinically abnormal results are identified by microscopic examination, a peripheral blood smear review is performed by a Hematopathologist at an additional charge.

If patient has not had a complete blood cell count in the last 3 days, one will be performed at an additional charge.

Clinical & Interpretive

Clinical Information

Under normal conditions, the morphology and proportion of each blood cell type is fairly consistent in corresponding age groups. The morphology and proportion of each blood cell type may change in various hematologic diseases. Differential leukocyte count and special smear evaluation is helpful in revealing the changes in morphology or proportion of each cell type in the peripheral blood.

An interpretive report will be provided.

**Interpretation**

The laboratory will provide an interpretive report of percentage of white cells and, if appropriate, evaluation of white cells, red cells, and platelets.

**Cautions**

A poorly prepared peripheral smear may result in less than optimal interpretation.
