Herpesvirus 7 IgG/IgM Ab Panel, IFA

Herpesvirus 7 IgG Antibody, IFA

Y038
<1:320

Herpesvirus 7 IgM Antibody, IFA

Y038
<1:20

REFERENCE RANGE: IgG <1:320

IgM <1:20

Human Herpesvirus 7 (HHV-7), a close relative of HHV-6, is found in >85% of the population, with transmission occurring in early childhood. Like HHV-6, HHV-7 is a cause of exanthem subitum

(roseola infantum). Due to the ubiquitous nature of HHV-7 infection, >80% of individuals in the general population exhibit HHV-7 IgG titers > or = 1:20; however, only 5% of these individuals exhibit titers >1:320. Thus, HHV-7 IgG titers >1:320 are suggestive of recent HHV-7 infection. Detection of HHV-7-specific IgM is also indicative of recent infection.

This test was developed and its performance characteristics have been determined by Focus Diagnostics. Performance characteristics refer to the analytical performance of the test.
