

Patient ID SA00000993	Patient Name SAMPLEREPDMGLM, VLD20150713A0254	Birth Date 1981-01-01	Gender M	Age 34
Order Number SA00000993	Client Order Number SA00000993	Ordering Physician Client, Client	Report Notes	
Account Information C7028846 DLMP Rochester		Collected 12 Jul 2015 18:37		

Result Summary

MCR

No Alterations Identified

Result

MCR

BRAF	GNA11	GNAQ	KIT	NRAS
------	-------	------	-----	------

Provided diagnosis: melanoma

No reportable somatic alterations were identified within the tested genes including BRAF (i.e. specimen is BRAF wild-type).

Interpretation

1 MCR

ASSOCIATIONS BETWEEN BRAF MUTATIONS AND MELANOMA

Current data suggest that the efficacy of BRAF-targeted therapy and anti-MEK therapy in melanoma is limited to patients whose tumors harbor a p.V600E/K mutation. Thus, the absence of these mutations in this tumor specimen suggests that such therapies may have limited therapeutic value for this patient (1–6).

ADDITIONAL INFORMATION

Microscopic examination was performed by a pathologist to identify areas of tumor for enrichment by macrodissection. Next generation sequencing is performed to test for the presence of a mutation within targeted regions of the following genes: BRAF, GNA11, GNAQ, KIT, and NRAS. Mutation nomenclature is based on the following GenBank accession numbers (build GRCh37 (h19)): BRAF NM_004333, GNA11 NM_002067, GNAQ NM_002072, KIT NM_000222, and NRAS NM_002524. See www.mayomedicallaboratories.com (Test ID MELP) for additional information about this test.

CLINICAL CORRELATIONS

Test results should be interpreted in context of clinical findings, tumor sampling, histopathology, and other laboratory data. If results obtained do not match other clinical or laboratory findings, please contact the laboratory for possible interpretation. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.

The presence or absence of a mutation may not be predictive of response to therapy in all patients.

TECHNICAL LIMITATIONS

This test does not detect large insertions, deletions, or duplications or genomic copy number variants.

This assay has been shown to detect >99% of single base substitutions and >93% of known COSMIC insertions and deletions up to 22bp in length within the reportable range of this assay.

A negative (wild type) result does not rule out the presence of a mutation that may be present but below the limits of detection of this assay. The analytical sensitivity of this assay is 5–10% with a minimum coverage of 100X.

Rare polymorphisms may be present that could lead to false negative or false positive results.

This test cannot differentiate between somatic and germline alterations. Additional testing may be necessary to clarify the significance of results if there is a potential hereditary risk.

Metastatic and corresponding primary lesions may have discordant results.
